2,372 Combined Siblingship Index:

DNA testing was done to determine siblingship of the alleged siblings. Based on testing results obtained from analyses of the DNA loci listed, the probability of full-siblingship is 99.95%. The likelihood that they share the same biological father is 2,372 to 1. This probability of siblingship is calculated by comparing to an untested, unrelated, random individual of the Caucasian population (assumes prior probability equals 0.50).

Subscribed and sworn before me on January 8, 2025
